Do research and fill in your own key word/answers behind each tab. However, brief answers are provided below as well. Be sure to cut each lift tab on the solid line.

Answers

Amphibian comes from the Greek. "Amphi" means double and "bios" means life. Double life or part of their life is spent in water and part on land.

They are ectothermic or cold blooded. They depend on an external energy source to provide their bodies with the needed heat.

They normally have four legs.

The surface of their skin is normally slippery or smooth in frogs and more dry and bumpy in toads.

Yes, most amphibians lay eggs in jelly like masses called spawning with the except of some species of frogs who give birth to live young.

Yes they live in the water. Their name suggest that they live part in water and part in land. Some species only go in the water for reproduction and some live more of their life near or around water. However, some frogs live in the deserts and dry land.
