

Did you know . . .

that a group of toads is called a knot?

that camouflage is important to toads? Camouflage also called cryptic coloration is the color of an organism which allows it to blend in with its surroundings.

that a toad lays long strings of eggs compared to the frog that lays large cluster of eggs?

there are toads that obtain over half the water they need through a baggy patch on their pelvis that they press against moist surfaces?

that frogs/toads are good bio-indicators? A bio-indicator is a living creature indicating or telling you something about the area that it lives in. If the frogs are abundant the area is healthy. What if they are mutant or malformed? How healthy is your area?
